Abstract. Cold hardiness testing methods have developed from the search to understand the many thermodynamic, physiological, anatomical, and biochemical features of plants involved in acclimation and deacclimation to freezing temperatures. These methods have further evolved from a need to quickly monitor cold hardiness to ensure successful production of conifer nursery stock for reforestation.

The cold tolerance of needles was strongly correlated with their soluble sugar contents. Spruce maintained cold hardiness by having larger reserves of sugars and lower rates of respiration which decreased more rapidly as sugars were depleted. Tolerance of lodgepole pine to frost desiccation was also much reduced following the 5.5°C treatment.
