Since the absolute value is not changed by a sign swap, this corresponds to equal probabilities.

Abstract. The relativity quantum theory of an electron moving in a given electromagnetic field, although successful in predicting the spin properties of the electron, yet involves one serious difficulty which shows that some fundamental alteration is necessary before we can regard it as an accurate description of nature. This difficulty is connected with the fact that the wave equation, which is of the

The interpretation of the so-called "negative energy states" proposed by Dirac(1) leads, as it is well known, to a substantially symmetric description of electrons and positrons.

The one-electron universe postulate, proposed by John Wheeler in a telephone call to Richard Feynman in the spring of 1940, is the hypothesis that all electrons and positrons are actually manifestations of a single entity moving backwards and forwards in time. According to Feynman: I received a telephone call one day at the graduate college at Princeton from Professor Wheeler, in which he said ...

Electrons are constituents of atoms; the number of electrons in a neutral atom is equal to the atomic number, that is, to the number of protons in the nucleus (see ATOM). What is now often called Lorentz ether theory (LET) has its roots in Hendrik Lorentz 's "theory of electrons", which was the final point in the development of the classical aether theories at the end of the 19th and at the beginning of the 20th century. Lorentz's initial theory was created between 1892 and 1895 and was based on a completely motionless aether.
